

User Testing & Feedback

Cumulus Neuroscience has developed a new digital technology to monitor brain health at home.

Our aim is to detect early signs of dementia and to support development of therapies. However, this is dependent on patients and their family being willing and able to use our technology regularly and consistently.

We want to find out what people from the people with experience of dementia think of our technology.

The Role

To ensure that our technology is designed with user needs at the forefront we want to involve people who can help us make it accessible and usable for people with dementia.

If you would like to be one of our test users by giving input and testing our technology as we develop it, please get in touch.

- ✓ £15 per hour
- ✓ Fully remote and flexible

We're very keen to hear from

- ✓ People living with early stage dementia and their primary carers

We're also interested to hear from

- ✓ Dementia Professionals
- ✓ Family members of people living with dementia

Requirements

- ✓ Have access to Wi-Fi
